

IN THE CLAIMS

Please amend the claims as follows:

1. (Currently Amended) A system for implementing a failover policy comprising:
a cluster infrastructure for managing a plurality of nodes;
a high availability infrastructure for providing group and cluster membership services;
and
a high availability script execution component operative to receive a failover script and at least one failover attribute and operative to produce a run-time failover domain.
2. (Currently Amended) A method for determining a target node for a failover, comprising:
executing a failover script, said script producing a run-time failover domain, said run-time failover domain having an ordered list of nodes;
receiving a failover attribute; and
based on the failover attribute and failover domain, selecting a node upon which to locate a resource.
3. (New) The method of claim 2, further comprising receiving an initial failover domain and wherein the failover script is executed to produce the run-time failover domain.
4. (New) The method of claim 2, further comprising:
defining a resource group including a set of resources; and
associating the failover script and the failover attribute with the resource group.
5. (New) The method of claim 2, wherein selecting a node comprises selecting a first node in the ordered list of nodes.
6. (New) The method of claim 2, further comprising executing an action script for a resource on the target node.

7. (New) The method of claim 6, wherein the action script verifies that the resource is configured on the target node.
8. (New) The method of claim 6, wherein the action script verifies that the resource is not already running on the target node.
9. (New) The method of claim 6, wherein the action script starts the resource.
10. (New) The method of claim 6, wherein the action script stops the resource.
11. (New) The system of claim 1, wherein the script is a shell script.
12. (New) The system of claim 1, wherein the script is a Perl script.
13. (New) The system of claim 1, wherein the failover script receives an initial failover domain as input to produce the run-time failover domain.
